

Action Description	Command Code Syntax (F2)	Developer Backend Function
Core System Commands	Dual-Command Entry Stack: (;)	You can stack commands by separating them with a semicolon (;), allowing you to execute multiple actions in a single line. Use page up or page down to review historical commands. Use tap to autofill unit.
CMDS	CMDS	Opens this documentation lookup reference panel frame.
TRAINING	TRAINING	Flushes current terminal views and generates mock training configurations instantly.
ON	ON [Name] [Callsign] [Law/Fire] [Agency]	Registers a new unit onto the active workspace. Agency is free-text (e.g. LSPD, BCSO). Use underscores for spaces in names, e.g., John_Doe
OFF	OFF [Callsign]	Removes and signs off an active radio asset unit from the registry completely.
II	II [Code/Type] / [Location] / [Comments]	Initiate Incident: Directly pushes a new unassigned call logging incident to the queue stack.
FI	FI [Callsign] [Code/Type] / [Location] / [Comments]	Field Initiate: Creates an incident call log frame, automatically links the listed callsign, and updates their status flag to ON SCENE.
DE	DE [UnitCallsign] [CallID]	Dispatch En Route: Dispatches the specified unit out to an active incident log ID block.
TS	TS [Callsign(s)] [Location] / [Comments] / [Plate] / [Vehicle Info]	Traffic Stop: Creates a Traffic Stop (TS) incident at the given location, links the listed callsign (s), sets them ON SCENE, and optionally logs a stopped vehicle's plate/info.
CM	CM [CallID OR UnitCallsign] [Text Log]	Appends an active update comment string block directly onto a call layout frame.
C	C [Callsign] [Disposition]	Close Incident: Closes the incident and moves it to History. Callsign mode: provide a unit callsign — the call is auto-resolved from that unit's active assignment; no separate Unit token needed. Call ID mode: provide the Call ID followed by a disposition and a closing unit callsign. Disposition codes: CC, CD, CS, CE, DOA, EMST, FD, GI, NR, PD, REF, RTF, SERV, XFR. Call is fully recoverable via CLOSED.
US	US [Callsign(s)] [Status Shorthand]	Unit Status Update: Changes one or more units to the specified status. Accepts all status shorthands (e.g. OS, AV, TR). Multiple callsigns supported before the status token.
EU	EU [Callsign]	Edit Unit: Launches the interactive management window context frame for the targeted unit.
IR	IR [Call ID or Callsign]	Incident Recall: Launches the full call management workspace focus frame for the target incident. Also accepts a unit callsign — resolves to that unit's assigned call.
BOLO	BOLO [VEH or SUSP] [Descriptor Info] [Unit (Issuer)]	Issue BOLO: Instantly creates a new alert on the Alerts & BOLO board with the descriptor info pre-filled. Optional trailing unit callsign is logged as the issuer. Open the Alerts & BOLOs tab afterward to fill in specific plate/name/DOB/etc fields.
CLOSED	CLOSED [Call ID] [Y/N]	History & Recall: CLOSED alone opens the History tab (10 most recent closed incidents). CLOSED [Call ID] reviews that incident's disposition. Add Y to reopen it (returns to active board, logs a system audit comment) or N to leave it closed.
GU	GU [Callsign 1] [Callsign 2] ... [Name]	Group Unit: Merges two or more units into a composite group sharing a single roster card and status. Group name (or composite callsign) is then recognized in status macros and US. Use GU [GroupCallsign] to dissolve a group.
Status Change Macros	[Status Shortcut] [UnitCallsign] [Optional Note]	
Available (Clear Frequency)	AV	
Available In Quarters	AIQ	
Available On Radio	AOR

Features

Efficiency & Workflow Tools

Dual-Command Entry Stack: You can stack commands by separating them with a semicolon (;), allowing you to execute multiple actions in a single line.

Dynamic Grouping (GU): You can merge two or more unit cards into a single composite identifier (e.g., for multi-manned vehicles) using the GU command. This group then shares a single roster card and status, and can be updated collectively.

Append-Only Incident Logs: Historical logs are strictly immutable. Once a call is closed with a disposition code, it is moved to historical storage, ensuring data integrity while still allowing dispatchers to recall or reopen the incident if necessary.

Automatic Meta-Tagging: Every comment added to a call is automatically prefixed with a timestamp, the operator's callsign, and the text, ensuring a clear and verifiable narrative stream.

Automated Incident Messaging: If a call's location or type is updated, the system automatically appends a message to the incident log to notify users of the change

Incident & Unit Management

Field Initiation (FI): This command allows for rapid incident creation; it generates the call log, links the unit, and immediately sets their status to "On Scene".

BOLO & Alerts Infrastructure: The system features a dedicated board for tracking server-wide active alerts and BOLOs. You can issue a BOLO with the BOLO command, which automatically populates the board, allowing you to fill in specific details like names or vehicle plates later.

Disposition Codes: Calls cannot be closed without a valid disposition code (e.g., RTF, CC, CD, CS, CE, DOA, EMST, FD, GI, NR, PD, REF, SERV, XFR).

Incident Recall (IR): Use this to quickly focus your workspace on a specific active incident or a unit's current assignment.

Layout Management

You can save, customize, and reset your UI configuration:

Customizable Layouts: The system includes a layout modal where you can modify the UI arrangement to suit your specific dispatch needs.

Persistent Settings: Your workspace configuration is saved locally, meaning your layout will persist and automatically apply when you reload the page.

Reset Capability: If you need to revert to the default view, a `resetLayout` function is included to instantly restore the original UI settings.

Wildland	Wildlife

Priority Events	Color Code
Priority 1 - Emergency	BLUE
Priority 2 - Urgent	RED
Priority 3 - Routine	GREEN

Tr Task	Status	Column 1
Add Call Comment	Completed	
Agency Logo	Cut	
Append-Only Restriction:	Completed	Append-Only Restriction: The historical log must be strictly immutable. Dispatchers and units cannot click into or edit existing lines, preventing any overwrite or deletion risks. New data can only be introduced by executing a submission string or pressing Enter on the input field.
Automated Messaging for Incident Updates	Completed	If the location or call type is changed, an automated message must be added to the narrative stream showing what was changed. [Location/Event Class Update Old to New (New bolded)] Should be orange text
Automatic Meta-Tagging Cascade:	Completed	Automatic Meta-Tagging Cascade: Upon every comment submission, the database must instantly prepend an automated metadata string container. The layout format must strictly execute as: [HH:MM:SS] [Operator Callsign] —► [Input Text String].
BOLO & Alerts Section	Completed	Add a section to add/edit/clear bolos or alerts. Follows the same Suspects & Roster Relational Ledger and Vehicles Relational Mapping Ledger logic. A BOLO command may be useful: BOLO [VEH or SUSP] [info] [unit] Alerts & BOLO Board Infrastructure: A dedicated workspace view must track server-wide active alerts and BOLOs for both suspects and vehicles. The data handling pipelines for the BOLO generation boards must utilize the exact same vehicle and suspect token tracking logic as the active incident creation modals, using a standardized global search bar layout to instantly query active alerts.
CAD Name	Completed	Find a better name (FiveM Advanced Motorola-Style CAD)
Clear Unit from Call	Completed	
Dispatch Unit to Call	Completed	
Dispositions (Global)	Completed	Incident Closure (C; Call Number): A call cannot be shifted out of active status without an assigned closing disposition code parameter. Once a call is closed via a disposition string (e.g., C; 1002 RTF), the incident state data is moved out of active screens and committed to historical tracking storage, retaining a recall toggle that allows dispatchers to review and completely reopen the incident row if needed.
Dual-Command Entry Stack (// Command):	Completed	It works but it needs to tell the user that using ; is active and working properly. Needs to use the same help logic as if they were working on one command
Dynamic Grouping (+Group)	Completed	Dynamic Grouping (+Group): The system must allow two or more distinct unit cards to be merged under a singular composite identifier (representing a two or more manned squad car) via UI selection or command line. The composite group inherits collective status updates universally across the roster.
Edit Incident Profile	Completed	Launches the full call management workspace focus frame for the target call. (might change to Recall Incident "RI"
Edit Unit Profile	Completed	Launches the interactive management window context frame for the targeted unit.
Federal Agencies	Cut	
Federal Capabilities	Cut	
Field Initiate Incident	Completed	
Fire Capabilities	Completed	
Fire Dispatch Events	Completed	
Group Unit Command	Completed	GU [Callsign 1 Callsign 2...etc] [Name] sets grouped units unavailable. Or create a Grouped status under the unavailable section
Initiate Incident (New Call)	Completed	
Law Agencies	Cut	
Law Capabilities	Completed	
Law Dispatch Events	Completed	
Log Unit Off (Sign-Out)	Completed	
Log Unit On (Sign-In)	Completed	
Move Hotkeys, CMD Bar, Clear, Demo, Reset	Completed	Move these to the bottom right side of the screen
On Scene	Completed	
Page Up Command History	Completed	
Reorder Incident Call Log Frame	Completed	A user will be able to tab between Call Type, Location, and Comments freely. Priority and Call source are auto-generated and do not need to be tabable.
Small Window Formatting	Completed	Balance space for each section when in a small view. Text and fields become too small or don't format neatly. Clock and upper tray collide into each other and with each other.
Toggle Suspect & Vehicle call section	Completed	Add a button to toggle or switch between different vehicles if there are more than one. Will help to lessen the visual look of a call
